<b>Program Impact Story</b> Liz was 25 years old when she came to the Family Planning clinic for her exam. She had been receiving her birth control method through a private provider, but had not had yearly Pap smears (a yearly Pap smear is part of routine care for clients at the Health Department.). Her last Pap smear had been more than five years ago and she had been experiencing irregular bleeding and discomfort. During the exam, it was evident something was wrong; her cervix was very abnormal in appearance and the Pap smear confirmed that she had malignant cervical cancer. In the U.S., women diagnosed with cervical cancer are most likely to have had delayed Pap smear screenings for five or more years. Liz was uninsured and her need for care was already beyond our usual referral resources. After talking with a local OB/GYN, a call was made to KU Medical Center. Due to the urgency of the situation, a specialist was willing to see Liz and began her evaluation without assurance that payment would be possible. As a result of this collaboration, Liz was able to be diagnosed and treated and was recovering well at her last update. <span style="float: right;"><i>Name has been changed.</i></span>
