

Together, day by day, building a healthy community

Heart Attack | Adult

Definition | Percent of adults who reported they ever had a heart attack, also called a myocardial infarction.

Importance | A heart attack occurs when a section of the heart muscle dies or gets damaged because of reduced blood supply. Coronary Artery Disease (CAD) is the main cause of heart attack. A less common cause is a severe spasm of a coronary artery, which also can prevent blood supply from reaching the heart.¹

Where are we | In 2013, 1.5% of adults in Douglas County reported ever having a heart attack. Douglas County had a lower percent than the state of Kansas and U.S.

Health Disparities | Among adults in Kansas in 2013:

- Men were more likely than women to report ever having a heart attack.
- Individuals aged 65 and older were more likely than those at a younger age to report having a heart attack.

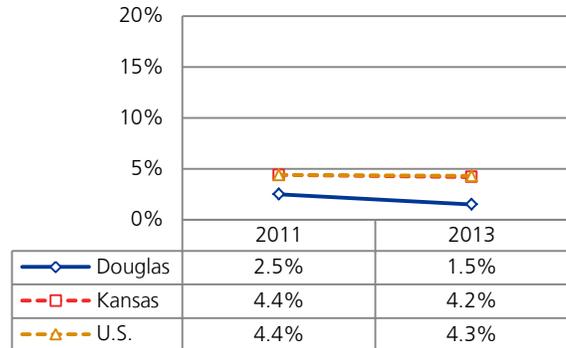

Healthy People 2020 Goal | Not available

Additional Information | In 2008, over 616,000 people died of heart disease. Heart disease caused almost 25% of deaths - almost one in every four - in the United States.¹

Major risk factors for a heart attack that you can control include smoking, overweight and obesity, high blood pressure, high cholesterol, diabetes, an unhealthy diet and lack of physical activity. Risk factors that you can't control include a family history of early heart disease and increasing age. Talk to your health care provider to find out whether you are at risk.²

Trend Analysis

Percent of adults who reported they ever had a heart attack³

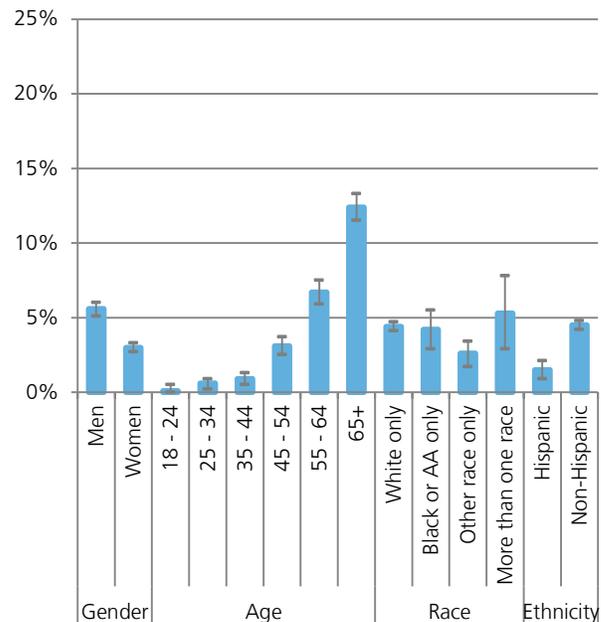

* The 2011 BRFSS data should be considered a baseline year for data analysis and is not directly comparable to previous years of BRFSS data because of changes in weighting methodology and the addition of cell phone respondents.

Disparity Analysis

Percent of adults who reported they ever had a heart attack³
